

Phase 2a closes: attention pooling does NOT robustly lift HER2 across seeds (median $\Delta \approx 0$, $p \gg 0.10$)
Single consistent positive signal is on luminal A ($\Delta \approx +0.02$ - 0.04 , $p \approx 0.07$ - 0.15) — small, secondary

A. HER2 n=68 pooled AUC — cross-seed view

Marker = mean of per-seed pooled AUCs; whisker = per-seed range (3 seeds for attention, 2 for P3)

B. Paired-fold Wilcoxon: attention variant vs Phase 3 winner

15 paired folds (seeds 42, 7, 123). Black outline = $p < 0.10$
